A: I believe you want to use two kernel images, one for the hard part (e.g., your GPUs and some of your CPUs) and one for the soft part (the rest of your CPUs and GPUs in the cloud). You can try training your model with the CPU part for a while, then training the entire model using the CPU part and the GPU parts. The idea is that you wait until your GPU and CPU parts agree, or at least reach some non-extreme level of convergence, and then switch to training the entire model with the CPU parts and the GPU parts. You can start with 40% CPU and 60% GPU, then 80% CPU and 20% GPU, etc. You can also load both kernel images in parallel, but you will need to apply weight sharing to your layers to ensure the soft part does not overtake your hard part. I'm not sure if you need to care about the frequency/memory/hardware of your GPU and CPU parts, but I would say you want to maximize the performance of your CPU and GPU parts. I hope this helps. Q: How to prevent a jQuery Dialog from being resized? Consider the following site: When the dialog box is displayed, if you try to scroll it doesn't move, instead it gets resized to make room for the scroll bar. Is there a way to prevent it from being resized? A: I think the solution is found in this article. How do you create a resizable jQuery dialog box? Q: Validate Session before response i am using MVC5 I wanted to validate a session before i send the response from the actionmethod...is it possible if (CurrentUser == null) { Response.Redirect("/Login"); } A: You could do something like this: if (HttpContext.Current.Session["MyUserSession"] == null) { // handle the error } If you look at your SessionState documentation, you can see what it contains here: The SessionState stores the session-state information for the Web server. As you can see, it

A: The problem you have is caused because the website is hosted on a Chinese server and most likely with a Chinese firewall that would prevent you from accessing it unless you are trying to access it from China or are using a proxy that is also installed in China. And to conclude: putty is not a perfect solution to this issue - you might get a better solution with port forwarding (and possibly encryption) which can be done with a firewall - either setting up the firewall rules directly on the firewall, or setting up a proxy server (possibly anonymising it if needed). A: Well, @HowToGeek solved the problem. However, I also had to update my router settings. The original settings are: open 443. https (SSL/TLS) 443. access Denied open 22. ssh ssh from outside 192.168.1.1 to 192.168.1.16. ssh from inside 192.168.1.1 to 192.168.1.16. verify RSA key based authentication. enabled. After the update, the settings now look like this: open 443. https (SSL/TLS) 443. access Allowed. open 22. ssh ssh from outside 192.168.1.1 to 192.168.1.16. ssh from 192.168.1.1 to 192.168.1.16. verify RSA key based authentication. enabled. Now I can access the file from anywhere in the world. Q: How to return HTTP Status when file saved/updated I have a get method, in which I am saving uploaded files to database, and store the data in blob(by thinking it is the best way to do the saving). The problem I have is the HTTP status I want f678ea9f9e
